

# <https://www.pricescopes.gr/>: EETT's new e-app to compare retail prices of telecommunications products and courier services

December 12th, 2016

EETT designed and launched “[Pricescopes](#)”, the price observatory for telecommunications and postal services. It is an innovative e-app for consumers enabling them to compare in a simple and reliable way the retail prices for commercially available products in fixed telephony, mobile telephony and Internet, as well as courier services for documents and parcel delivery in Greece.

The basic tools provided by EETT's [Pricescopes](#) are: a) the search of products by multiple criteria and b) the comparison of retail prices based on the consumer's use. By using Pricescopes, consumers can also:

- get updated information about new products, changes to existing product features, add-on packages and offers.
- change constantly the selected criteria/data and get

differentiated  
results.

– create personalized profiles which facilitate future searches and product comparisons.

The data are inserted and constantly updated by the providers in a uniform and consistent way, reinforcing the objectivity and transparency of the applied methodology.

EETT's Pricescope, which was developed in the context of the National Strategic Reference Framework 2007-2013 (operational program "Digital Convergence") aims at protecting consumer rights and ensuring their access to competitive and affordable choices of telecommunications and courier services.

With Pricescope, EETT, as the competent Regulatory Authority, enhances its actions as regards to promoting competition, supervising, monitoring and regulating electronic communications and postal services markets.

Check out Pricescope at  
<https://www.pricescope.gr>.

The application is also available in iOS and Android versions.
