

# General information

A numbering resource is any number used for the provision of electronic communications services. Namely, the number resources of the National Numbering Plan include geographic and non-geographic numbers, Carrier Selection/Pre-selection codes, short codes, routing prefixes, as well as numbers of internal numbering, addressing and identification of electronic communications networks.

EETT allocates and manages the number resources of the National Numbering Plan (in accordance with the relevant [Regulation](#)).

If you are interested in the allocation of numbering resources, you have to submit a relevant application to the registry of numbering resources through [eRegistry](#), where you will find all relevant instructions. You have the right to acquire numbering resources provided that you are active as a provider of services/networks under a General Authorization.
