European Space Agency – Satellite Communications

Presentation title

Monitoring from space - how to support regulators?

Abstract

ESA has started an initiative called “CleanWaves” – which aims to support industrial and institutional initiatives for spectrum monitoring, interference detection and mitigation and more efficient spectrum use. ESA will initiate several activities which seek to demonstrate the added-value of space-based spectrum monitoring to this field. Future space-based means can possibly be embedded into existing regional or international spectrum monitoring frameworks.

Short bio

Teodora Secara, Javier de Pablos and Frank Zeppenfeldt all work in the Directorate of Connectivity and Secure Communications and have a background in satellite communications, regulatory issues and partnership building in international environments..
